Patent No. 5865787

GENERAL INFORMATION:

APPLICANT: Silverman, Robert H.

APPLICANT: SenGupta, Dibyendu N.

TITLE OF INVENTION: Transgenic Plants Co-Expressing A

TITLE OF INVENTION: Functional Human 2-5A System

NUMBER OF SEQUENCES: 11

CORRESPONDENCE ADDRESS:

ADDRESSEE: Holland & Knight

STREET: One E. Broward Boulevard, #1300

CITY: Fort Lauderdale

STATE: Florida

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                       ŏ
                                                                                                                                                                                                                                                                                                                                                                                              δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ő
                                                                                                                                                                                                                                                           The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM36642-AAM42213) with noctropic, finanuosouppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervopathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activinibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       assays for receptor activity, arthritis and inflammation, leukaemias and C.N.S disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Note: The sequence data for this patent did not form part of the printed specification.

                                                                                                                                                                                                                                                        The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM36642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous system, such as peripheral nervous system diseases, such as localised neuropathies and central nervous system diseases, such as lateral sclerosis, and Shy-Drager Syndrome. Other uses include the latinisation of the activities such as: Immune system suppression, Activinhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, as a says for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence data for this patent did not form part of the printed

No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dr primed cDNA
                                                                                                                                                                                                                                                                                   gagaagttaatggaagctggagcccagatcgaattccgtgatatgcttgaatccacagcc 816

ij
libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intext 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                D, Klinger J, Kassam A;

The present sequence is one of 3351 sequences in a library of human polynucleotides. The library is used to detect differentially expressed genes correlated with a cancerous state of a mammalian cell and can detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies of the polynucleotides. The probes can be used for chromosome mapping of the polynucleotide and for detection of transcription levels. Ribozymes or antisense oligonucleotides can be generated. The polynucleotides and their gene products are used as genetic or biochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the carcinogenesis pathway and/or monitor the efficacy of therapies and preventive interventions. The polynucleotides, polypetides and antibodies against them can be used in pharmaceutical compositions to the cancers and proliferative disorders such as neoplasia,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Garcia PD, Klinger J, Kassam A;

The present sequence is one of 3351 sequences in a library of human polynucleotides. The library is used to detect differentially expressed genes correlated with a cancerous state of a mammalian cell and can detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies to produce probes for detection of mRNA and to produce additional copies or antisense oligonucleotides. The probes can be used for chromosome mapping of the polynucleotide and for detection of transcription levels. Ribozymes or antisense oligonucleotides can be generated. The polynucleotides and their gene products are used as genetic or biochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the carcinogenesis pathway and/or monitor the efficacy of therapies and preventive interventions. The polynucleotides, polypeptides and preventive interventions. The polynucleotides, polypeptides and create the cancers and proliferative disorders such as neoplasia, dysplasia and hyperplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; nootropic; immunosuppressant; cytostatic; gene therapy; cancer; per.pheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;

The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral scalerosis, and ShyDrager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin'inhibin activity, chemotactic/chemokinetic activity, haemostatic

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM36642-AAM42213) with nootropic, the encoded polypeptides (AAM36642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polymucleotides are useful in gene therapy. A composition containing a polypeptide or polymucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous system diseases, such as lateliner's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclearosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression. Activin/inhibin activity, chemotexic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and consistent of the printed consistent of the printed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ä

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
their fragments, immunoglobulins, inhibitors, drug compounds and pharmaceutical agents. Expression of (1) in a sample indicates the differentiation of embryonic stem cells into a tissue selected from brain, heart, kidney, liver, lung, skeletal muscle or pancreatic tissues. (1) and (11) are used to produce an expression profile that defines a metabolic or developmental process, treatment, condition, disease or disorder. The gene profile can be used for diagnosis, prognosis or monitoring of treatments and for investigating a predisposition to a disorder where the gene is associated with a cancer, immunopathology or neuropathology.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  immunostimulant; thrombolytic; coagulant; vasotropic; antidiabetic;

AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiflammatory; antibacterial; antiviral; antifungal; antirheumatic; antithiflammatory antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antianeamic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX associated disorder. The

```
cargines and polynucleotides encoding the polypeptides. The kinase polypeptides and their modulators are useful for treating a disease or disorder such as cancer, immune-related diseases, cardiovascular disease, brain or neuronal-associated disease and metabolic disorders, including cancers of tissues, cancers of hematopoietic origin, diseases of the central nervous system, diseases of the peripheral nervous system.

Alzheimer's disease, Parkinson's disease, multiple sclerosis, amyotrophic lateral sclerosis, viral infections, infections caused by prions, mood disorders, attention disorders, pain, sexual dysfunction, mood disorders, attention disorders, neurological disorders, dyskinesias, hypertension, psychotic disorders, neurological disorders, dyskinesias, for treating rhinitis, autoimmunity, atherosclerosis, psoriasis, costecarthritis, asthma, chronic inflammatory pelvic disease, chronic inflammatory bowel disease, rheumatoid arthritis, metabolic disorders and atherosclerosis, such as diabetes, obesity, cardiovascular diseases such as reperfusion, injury, coronary thrombosis, clothing disorders and atherosclerosis, coular diseases such as diseases such as diseases such as diseases such as diseases are described as diseases and a delegant relation, collegant relations and advantance diseases are described as diseases and a diseases and a delegant relation, collegant diseases are as glaucoma, retinopathy and macular desentation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       dementia, manic depression, etc. The polynucleotides are useful in gene therapy techniques to treat the above mentioned disorders. This sequence encodes the human ankyrin family protein, ANFP, of the invention. Host cells containing an expression vector containing the polynucleotide sequence can be cultured to produce ANFP, which can be used for diagnosis or treatment of autoimmune, inflammatory, proliferative and vesicle-trafficking disorders. Disorders which can be proliferative and vesicle-trafficking disorders. Disorders which can be treated include acquired immune deficiency syndrome (AIDS), allergies, amyloidosis, anaemia, asthma, atherosclerosis, bronchitis, Crohn's disease, atopic dermatitis, diabetes mellitus, irritable bowel syndrome, myocardial or pericardial inflammation, osteoporosis, rheumatoid contraction probe to detect ANFP-encoding polynucleotides and so be used as a hybridisation probe to detect ANFP-encoding polynucleotides in biological camples. Purified ANFP can be used to produce antibodies or to screen libraries of pharmaceutical agents to find agents that specifically bind ANFP. The DNA and its antisense sequence can be used in therapeutic compositions en of the compositions en of the absence and excess of confidence and to indicate the absence and excess of contraction in solution of ANFP and monitor its levels during therapeutic

                                                                                                                                                                                                                                                                                                                                                                                              Gaps
signalling protein (SOCS). SOCS can be used to screen for naturally occurring antibodies to SOCS, which may occur, e.g. in some autoimmu diseases. Alternatively, specific antibodies can be used to screen for SOCS, which is useful as a knowledge of SOCS levels may be important for the diagnosis of certain cancers. Soluble SOCS polypeptides can be used to treat disease, injury or abnormality involving cytokine mediated cellular responsiveness, e.g. hyperimmunity, immunosuppression, allergies and hypertension.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ankyrin G119; AnkG119; kidney; human; spectrin binding domain; regulatory domain; integral membrane protein; secretary protein; ds.

/note="Organ: Kidney; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: ECO RI; Plasmid DNA from the normalized library NCI_CGAP_Kid3 was prepared, and ss circles were made in vitro. Pollowing HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1322376-1333911, 1456007-1456775, and 1506552-1502855). Subtraction by Bento Soares and M. . . Fatima Bonaldo. "
